## walsin technologies Autoforwarding

Posted by ShouJen - 2010/02/08 05:20

---

Hi, I am using Pegasus in LAN environment based on Microsoft Networking. I am wondering if there is anyway I can implement autoforwarding in Microsoft Networking instead of Novel Netware. Basically, all our external emails will be sent to the gateway where another program will upload to the ISP through UUCP. Does Pegasus have SDK that allows me to write one myself? Thanks!

---

I have tried using the command line `Pmail -r -a -u username` with the Pmail filter rule set when detecting @ at the FROM: field forward to sjn(my username). Somehow I don't think the command line is working for me. Must the -u be executed on a Netware system? Yes, on a standalone multiuser system it's -i username. The i switch doesn't seem to work for me. It's not one of the switches in the help list. Is it because of my version of Pmail. I think I am using 3.3, not the latest. If anyone is curious about my question, I am just wondering if there is any method to perform autoforwarding NOT on a Novel Netware system. Thanks for all the people who try to solve the problems with me. Really appreciate that. - Hide quoted text -- Show quoted text -
